Guide

Door guide: choosing the right door

Whether you need a sturdy industrial door, a fast door for efficient flow or a secure solution for a garage or warehouse, we help you find the right door.

Which door suits you?

A quick overview of how the doors open and when they fit. Not sure? Get in touch and we will help you choose.

	Door type	How it opens	Choose it when
	**Sectional doors**	The sections slide up and park flat under the ceiling	You want a space-saving door for a warehouse, workshop or commercial building
	**Roller doors**	The curtain rolls up into a box above the opening	There is little room in the ceiling above the opening
	**Fire doors**	Closes automatically in a fire	The building must contain fire and smoke, as in industrial buildings and car parks
	**Garage doors**	As a sectional, up-and-over or roller door	You need a door for a private garage or a smaller building
	**Folding doors**	The leaves fold together to the side	The opening is large and the ceiling height limited
	**Security doors**	A sectional door in a reinforced build	Security must be high, as in warehouses and industry

	**High-speed doors**	Opens and closes very quickly	Traffic is heavy, as in warehouses, cold rooms and production

Door solutions

Sectional doors

A sectional door is made of several panels, or sections. When the door opens, the sections slide up and park flat under the ceiling, so the whole opening is clear without the door taking up space in front of it or beside it. That makes it a practical choice for warehouses, workshops and commercial buildings.

Roller doors

A roller door works like a metal roller blind. The curtain rolls up into a box right above the opening, so the door needs very little space under the ceiling. It suits places where the space above the opening is tight, or where the ceiling space is needed for something else.

Fire doors

A fire door is built to stop fire and smoke from spreading from one part of a building to another. In a fire the door closes automatically, keeping the fire inside its section. Fire doors are common in industrial buildings and car parks.

Garage doors

For private garages and smaller buildings we supply sectional, up-and-over and roller doors. Which one suits you best depends on the garage, the space under the ceiling and how the door will be used day to day.

Folding doors

A folding door is split into several leaves that fold together to the side as the door opens. It needs little space above the opening, which makes it well suited to large openings where the ceiling height is limited.

Security doors

Security-rated doors are extra strong and tested against break-ins. They are used where security demands are high, for example in warehouses and industry, and give better protection to what is kept inside.

High-speed doors

A high-speed door opens and closes very quickly, so the opening stays open for as short a time as possible. It is used where traffic through the door is heavy, for example in warehouses, cold rooms and production halls, and keeps the flow through the building steady.
